

VALUATION + 5-YEAR REVENUE FORECAST

Boat Dealership Platform Strategic Value, Build Cost, and Commercial Forecast

Detailed valuation report for the Boat Dealership Cloud Operating Diagram / Builder / Flow Map platform, reframed as a production-grade marine dealership operations product with deployment, monetization, and exit-value assumptions.

PREPARED

May 20, 2026

BEST BASE-CASE BUILD BUDGET

\$3.07M

PRODUCTION-READY STRATEGIC VALUE

\$3.5M to \$6.5M

CURRENT SCOPE

236 Nodes

Modeled operating entities across the live canvas, flow builder, and top-down flow map.

RELATIONSHIP DEPTH

787 Edges

Cross-functional handoffs spanning demand, operations, finance, marina, and retention systems.

COMMERCIAL ENTRY BAND

\$8M to \$18M

Most practical early-traction valuation once recurring revenue and customer proof appear.

UPSIDE BAND

\$20M to \$45M

Reachable if the product becomes a sticky niche operating layer for marine dealer groups.

Executive Position

This platform should not be valued like a simple diagramming interface. The current asset already contains a meaningful operating model, a reusable domain graph, multiple end-user views, export behavior, state persistence, and a clear roadmap toward a real vertical SaaS or enterprise operating layer.

Most Defensible Short Answer

If fully built into a production-grade marine dealership operations platform, the project likely represents roughly **\$2.0M to \$4.8M** in full build cost, with a practical base-case budget near **\$3.07M**. Once production ready, but before strong recurring revenue, it reasonably supports a strategic asset value of about **\$3.5M to \$6.5M**.

Commercial Upside View

Once paying customers, repeatable onboarding, and real ARR exist, the valuation should move from replacement-cost logic to recurring-revenue logic. That is the shift that opens the path toward **\$8M to \$18M** in early traction, and potentially **\$20M to \$45M** if the product becomes a durable category platform.

Interactive live canvas

Flow builder with add-node and add-edge controls

Top-down flow map

PDF, SVG, Mermaid, and JSON exports

Local state persistence

Quick ops modes

Ctrl/Cmd multi-select

Domain-specific marine dealership model

What Is Actually Being Valued

The current project is best understood as the front edge of a vertical operations system for marine dealerships and marina-linked revenue, not just a presentation artifact. The existing prototype already encodes a significant amount of business process logic and commercial framing.

Current Surfaces
Live interactive operating diagram, separate top-down scaffold, current PDF/SVG exports, and structured JSON/Mermaid downloads.

Modeled Scope
14 groups, 236 nodes, 787 edges, 236 descriptions, and 236 stored positions in the latest working export.

Current Limitation
The project still reads as a front-end-heavy prototype until it has a production backend, live auth, tenants, connectors, audit trails, and customer deployment tooling.

Strategic Asset Value = Replacement Cost + Domain IP Premium + Time Saved - Commercialization Discount

Commercialization discount remains meaningful until there is recurring revenue, referenceable customers, and deployment repeatability.

Full Production Build Cost

The cost model below assumes a serious build, not a compressed demo. It includes architecture, product work, production frontend hardening, backend and tenant systems, connectors, KPI/reporting, security, release management, and deployment readiness.

COST CATEGORY	LOW	BASE	HIGH	WHY IT MATTERS
Product strategy, discovery, architecture	\$90K	\$140K	\$200K	Translates the domain graph into a sellable platform and prevents expensive rework later.
UX/UI and interaction design	\$120K	\$180K	\$260K	Required to move from a capable prototype into a product operators can live in daily.
Frontend production application hardening	\$220K	\$320K	\$450K	Includes stability, performance, accessibility, and reusable interface systems.
Backend, APIs, persistence, auth, tenant model	\$350K	\$550K	\$850K	This is the largest readiness gap between current prototype value and real platform value.
Integrations and partner connectors	\$300K	\$500K	\$850K	Marine dealer software becomes sticky only when it is wired into real operational systems.
Analytics, KPI engine, reporting, data model	\$220K	\$380K	\$650K	Executive and operator dashboards are a direct value driver and a major part of retention.
Security, RBAC, audit, compliance, admin tooling	\$160K	\$280K	\$450K	Necessary for trust, deployment approval, and enterprise-grade account control.
QA, accessibility, performance, release testing	\$150K	\$240K	\$350K	Protects product credibility and reduces cost of customer-facing defects.
DevOps, cloud infrastructure, monitoring, deployment	\$140K	\$220K	\$350K	Turns the product from a codebase into a reliably deployable service.
Project leadership, documentation, training, UAT	\$170K	\$260K	\$380K	Critical for implementation success and operator handoff in enterprise accounts.

LOW CASE

\$1.92M

Only works if scope stays focused and platformization stays disciplined.

BASE CASE

\$3.07M

Most realistic full build budget for a credible production platform.

HIGH CASE

\$4.79M

Appropriate if integrations, enterprise control layers, and rollout complexity expand.

ESTIMATED BUILD WINDOW

9 to 15 Months

Assumes a real team, not a solo implementation with deferred hardening.

Annual Operating Cost After Launch

\$860K to \$2.34M annually, with a practical base run-rate near \$1.42M.

- Engineering maintenance and roadmap velocity
- Cloud, vendor APIs, and monitoring
- Support, QA, onboarding, and release ops
- Product operations, customer success, and pre-sales support

Custom Enterprise Delivery Angle

A one-client full implementation could reasonably quote in the \$2.2M to \$4.8M range, plus \$180K to \$720K in annual support.

- Implementation price is not the same as platform asset value
- Reusable IP value rises if the same core product can be deployed repeatedly

Commercialization Assumptions

The strongest monetization path is to sell this as a vertical operations platform for marine dealership and marina-linked revenue workflows, not as a standalone diagram tool. The value comes from operational embed, reporting, and cross-department decision control.

Primary Revenue Sources

- Annual software subscription by dealership group or operating entity
- Implementation and onboarding fees
- Integration and workflow configuration work
- Premium reporting, analytics, and executive control packages

Commercial Price Anchors

- Setup / onboarding: \$75K to \$250K
- Smaller annual contract: \$60K to \$120K
- Mid-market multi-site annual contract: \$120K to \$250K
- Strategic enterprise annual contract: \$250K to \$500K+

Highest-Value Operational Wedges

- Deal flow and funding control
- Service capacity and quality control
- Parts commerce and fulfillment visibility
- Marina yield and waterfront revenue
- Owner growth, renewal, referral, and upgrade triggers

Commercial Value = Exit ARR × Multiple, with pre-scale valuation anchored by strategic asset value until revenue scale becomes dominant

Five-Year Revenue Forecast Model

The forecast starts at the point where the platform is fully built and commercially deployable. Year 0 is the production-ready strategic asset stage, which this report values at roughly **\$3.5M to \$6.5M** before strong ARR exists. The forecast below then shows three commercialization paths.

Forecast Logic

Each scenario models active customer count, blended ARR per customer, exit ARR, additional setup/services revenue, and an indicative enterprise value range. Early years continue to reflect the strategic asset floor because revenue multiples alone tend to understate value before the platform is fully commercialized.

Scenario Summary

Conservative assumes slower adoption and lighter contract values. Base assumes a credible niche rollout with operational stickiness. Upside assumes stronger multi-site adoption, broader operator usage, and expanding module depth across marina, service, and financial control.

Pre-Scale Value Floor

YEAR 0: PRODUCTION READY, PRE-SCALE

STAGE	VALUE RANGE	INTERPRETATION
Production-ready strategic asset	\$3.5M to \$6.5M	The platform is deployable and credible, but still lacks enough ARR to be judged primarily on recurring revenue multiples.

Conservative Scenario

SLOW ADOPTION, SMALLER ACCOUNTS

YEAR	ACTIVE CUSTOMERS	AVG ARR / CUSTOMER	EXIT ARR
Y1	3	\$100K	\$0.30M
Y2	5	\$110K	\$0.55M
Y3	7	\$125K	\$0.88M
Y4	9	\$135K	\$1.22M
Y5	12	\$150K	\$1.80M

This path assumes adoption is real but measured, with smaller rooftop groups and longer sales cycles.

Base Scenario

CREDIBLE NICHE PLATFORM ROLLOUT

YEAR	ACTIVE CUSTOMERS	AVG ARR / CUSTOMER	EXIT ARR
Y1	5	\$130K	\$0.65M
Y2	8	\$150K	\$1.20M
Y3	12	\$175K	\$2.10M
Y4	16	\$200K	\$3.20M
Y5	20	\$230K	\$4.60M

This is the cleanest planning case for a strong but realistic marine vertical software company.

Upside Scenario

STRONGER MULTI-SITE PENETRATION

YEAR	ACTIVE CUSTOMERS	AVG ARR / CUSTOMER	EXIT ARR
Y1	6	\$150K	\$0.90M
Y2	10	\$185K	\$1.85M
Y3	15	\$210K	\$3.15M
Y4	22	\$230K	\$5.06M
Y5	30	\$260K	\$7.80M

This path requires category traction, strong retention, and broader expansion inside multi-location operator groups.

Scenario Drivers and Operating Assumptions

The forecast ranges above are not arbitrary. They depend on customer mix, retention, implementation burden, and how embedded the platform becomes inside the operator workflow.

Conservative Driver Set

- Smaller accounts or single-point operators
- Longer sales cycles and narrower rollout scope
- More services-heavy implementations and lower ARR density
- Gross retention roughly 88% to 90%
- Recurring-value proof takes longer to establish

Base Driver Set

- 2 to 4 rooftop or operating-unit deployments
- Recurring adoption across finance, service, marina, and retention use cases
- Moderate implementation revenue with rising software mix
- Gross retention roughly 90% to 93%
- Operator dashboards and workflow controls drive stickiness

Upside Driver Set

- Multi-site groups expand seat, workflow, and reporting footprint
- Product becomes part of daily operations, not just oversight
- Expansion revenue and premium modules raise contract value
- Gross retention roughly 93% to 95%
- Platform starts looking like category infrastructure within its niche

Strategic Buyer and Investor Lens

Different buyers will value this asset differently. Strategic buyers care about time-to-market, IP depth, and embedded workflow advantage. Financial buyers care more about repeatability, margins, retention, and concentration risk.

Potential Strategic Buyer Types

- Marine dealer software vendors looking to expand into workflow and analytics
- Marina or waterfront operations software providers seeking dealership adjacency
- Dealer-management or ERP players wanting a modern operating overlay
- Private-equity-backed platform consolidators building marine retail technology suites

What Raises Strategic Price

- Unique domain model that would take time to rebuild
- Demonstrated operational ROI in revenue, service throughput, or financial control
- Clean integration architecture and deployable connectors
- Referenceable customers and low churn in a specialized market

Why the Current Asset Already Commands Real Value

The project already contains more than mockup value because it encodes the operating model itself: demand, sales, F&I, service, parts, marina revenue, retention, analytics, governance, and third-party systems are already structured in one product concept.

Why the Valuation Still Gets Discounted

No visible live backend, no active customer contracts, no measured ARR, and no proven enterprise deployment repeatability. The market pays far more for demonstrated stickiness than for concept quality alone, even when the concept is strong.

Final Opinion

The cleanest way to talk about this project is to separate build cost, strategic asset value, and scaled commercial value. As a production-ready platform, it is best framed as a **\$3.5M to \$6.5M** strategic asset with a realistic build requirement near **\$3.07M**. With real paying customers and repeatable deployment, it can move into the **\$8M to \$18M** band, and if it becomes a sticky marine-operations category platform, the five-year upside can reasonably push into the **\$20M to \$45M** range.

- Best build-cost planning number: \$2.8M to \$3.3M
- Best production-ready strategic value band: \$3.5M to \$6.5M
- Best early-traction commercial value band: \$8M to \$18M
- Best mature niche-platform upside band: \$20M to \$45M
